Toilets

These practically indestructible precast toilets are designed to accommodate waterborne, chemical or pit latrine systems, small bore or soak away septic tanks, conservancy tanks or virtually any alternative sewage system.

Ideal for waterborne systems the toilets are available with any combination of toilet pans, showers, taps and wash trough basins. Basins are transported separately and easily fitted to the structure on site.

The integral floor has been designed for effective drainage and to provide the structure with a solid base to stand on which results in little foundation preparations.

Pipework, where applicable, is fitted on the inside of the toilet wall and pressure tested.

Unit Mass: 1125kg
